

CHALK BALL RANGE DESIGN

Introduction: The chalk ball program is designed to offer a unique and engaging experience for Scouts BSA, Sea Scouts, and Venturers participating in summer camps or weekend programs. For detailed guidance on how to implement this activity, please refer to the *National Range and Target Activities Manual*, available at [Scouting.org](https://www.scouting.org).

Range Layouts: When facilitating the chalk ball program, there are only two available options for range layouts. Each range layout creates a chalk ball course made up of aluminum horizontal spinning targets, vertical spinning targets, and cowbells. Each range layout has shooting positions with significant separation between each position.

Chalk Ball Range Design: This range design has shooting positions capable of handling multiple shooters at a time, each in their own lane. The range has signage and barriers, allowing containment of shots, and it bars unauthorized people from entering the shooting area. See Page 2.

Chalk Ball Action Trail Range Design: This range design creates a chalk ball action course, "trail", that is a series of targets presented in differing distances and types of targets, allowing the shooter to test their skills at differing sight pictures. The range has signage and barriers, allowing containment of shots, and it bars unauthorized people from entering the shooting area. See Page 3.
